BASIC ABSTRACT:

JP 63213563 A UPAB: 19930923

Polymer composite dielectric comprises (A) fine powder of oxide of ferroelectric substance comprising  $(\text{Pb}_{1-x})\text{TiO}_3$  is between 0.35 and 0.95) and (B) rubber-like polymer and/or (C) resinous polymer. (A) is obtd. by contacting an acid aqueous solution containing Pb, Ca and Ti with oxalic acid dissolved in at least one alcohol of ethanol, propanol, pentanol and hexanol, separating obtd. precipitate, neutralising the acid in the precipitate with an amine or ammonia, drying the precipitate, and subjecting it to thermal decomposition. The amount of the oxalic acid is the total of 0.98-1.02 mol per mol of each Pb and Ca and 0.49-0.51 mol per mol of Ti. The amount of (A) is (e.g. 2-150 pts.weight w.r.t. 10 pts.weight of (B) and/or (C)). The amount of the alcohol is (e.g. 1-5 volume per volume of the acid aqueous solution). The thermal decomposition is conducted (e.g. at 700-1100 deg.C). USE/ADVANTAGE - Used for electrodes. It has high dielectric constant. The particle size of (A) can be controlled according to application of the dielectric.
